I. INTRODUCTION

In excess of 25,000 pregnancies were reported among North Carolina's 10 to 19 year old females in 1981. While both the number and rate of such events have decreased slightly since 1978, there were still about 50 pregnancies per 1,000 females in this age group in 1981.

The topic of teenage pregnancy has been the focus of a great deal of attention in recent years, primarily because of the many issues stemming from the effects of these pregnancies on both the individuals involved and society at large. Some of these issues include those surrounding the economic impact of such pregnancies, perceived declines in moral standards and parent-child communications, as well as the many areas involving the health status of the population.

While each related issue merits careful consideration this cannot be accomplished without accurate data pertaining to these pregnancies. As the lead agency for the coordination of health data, the State Center for Health Statistics is charged with presenting such data for public examination and related research and planning efforts. With this in mind, the purpose of this report is to provide a basic statistical analysis of the reported pregnancies among North Carolina's 10 to 19 year olds. No attempt is made to explain or account for trends indicated by the data.

One problem in presenting data pertaining to teenage pregnancies is defining the population itself. Much of the literature on this subject refers only to incidents occurring to 15-19 year olds. The fact that in 1981 North Carolina recorded 772 pregnancies to adolescents in the 10-14 age group necessitates their inclusion in any thorough analysis of this topic. Further, this report distinguishes between females 15-17 and those 18-19 years old because the former have not yet reached the age of legal consent and are often less biologically

mature. As such, pregnancies among these young women may present different legal, social, and health ramifications and should be examined separately. Thus, the data shown in Appendix B and discussed throughout the text of this report represent pregnancies reported among four distinct age groups: 10-14, 15-17, 18-19, and 20 or older (for comparative purposes). Rate calculations are based on the female population in these age categories unless otherwise stipulated. In terms of race, only two groups are distinguished, white and nonwhite. Nonwhite racial groups are incorporated into the category labeled "other" in the appendix tables.

The data utilized in this report include induced abortions, live births, and fetal deaths as reported to the Division of Health Services. The sum of these outcomes represents total reported pregnancies. Areas of limitation of the data include the unavailability of statistics on abortions received by North Carolina residents in other states and the nonreporting of fetal deaths occurring very early in pregnancy (prior to 20 weeks gestation). The population data employed in rate computations were provided by the State Data Center in the Office of Budget and Management. These numbers are age/race-specific estimates derived from the 1970 and 1980 census counts.

The tables in Appendix B show the numbers of pregnancies reported during 1981 for North Carolina residents by age, race, and pregnancy outcome (i.e., induced abortions, live births, fetal deaths, and total pregnancies). Also shown are the numbers which occurred out of wedlock as well as age/race-specific rates per 1,000 female population for 1981 with the percent change in these rates since 1978. These data are presented for North Carolina, Department of Human Resources and Perinatal Care Regions, and each county. Fetal mortality rates were not computed due to the very small numbers for counties.

II. TOTAL REPORTED PREGNANCIES

With the 1973 liberalization of abortion laws and the ensuing increase in the number of induced abortions, standard birth and fertility rates have become inadequate measures of the overall incidence of pregnancy. In response to these inadequacies, the Minnesota Department of Health introduced the concept of a pregnancy rate which incorporated all reported pregnancies regardless of their outcome (2). This rate has rapidly replaced the traditional measures as a more complete representation of all known conceptions.

Pregnancies among North Carolina's 10 to 19 year olds numbered 25,199 in 1981, for a pregnancy rate of 50.3 per 1,000 females in this age group. The number of these pregnancies decreased about 4 percent since 1978, while the rate decreased 2.5 percent. Table 1 shows the number and rate of pregnancies for 1978 and 1981 by age and race and documents decreases in the rates since 1978. The only rate increase was for nonwhite 10-14 year olds.

Nonwhite	10874	82.7	71.7	10412	86.2	69.6	-2.9

* Total pregnancies include induced abortions, live births, and fetal deaths.

\+ Rates per 1,000 female population, race/age-specific.

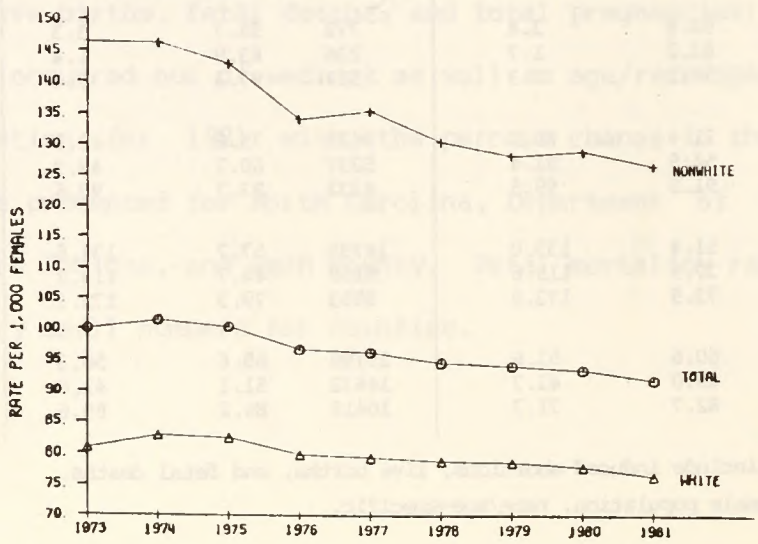
Table 1 also shows the percentage of pregnancies which occurred out of wedlock. For 10-19 year olds, this percentage increased from 60 to 65 between 1978 and 1981 and remained higher for nonwhites throughout the period. In terms of age, the percentage of out-of-wedlock pregnancies was highest among 10-14 year olds and lowest for the 18-19 age group.

While population figures are not available for these age groups by martial status, applying the incidence of out-of-wedlock pregnancies to the number of females in a particular age group produces a population-based percentage. In 1981 there were more than 6 pregnancies per 100 females 15-17 years old; almost 5 of these teenagers were unmarried when their pregnancy outcome was recorded. Among 18 and 19 year olds there were 13 pregnancies recorded per 100, more than 7 of these were out-of-wedlock.

Overall, the pregnancy rate among 15-19 year olds decreased between 1973 and 1981. In fact, after peaking at 101 per 1,000 in 1974, this rate has undergone a small but steady decline throughout the period. Declines were evident among both whites and nonwhites between 1973 and 1981; however, the rate for nonwhites declined more (13.5 percent) than that for whites. Figure A documents North Carolina's pregnancy rates among females 15-19 years old from 1973 through 1981 and delineates this downward trend.

FIGURE A

PREGNANCY RATES, AGES 15-19 BY RACE, NORTH CAROLINA: 1973-1981



The overall incidence of pregnancy among the state's 10-19 year olds has actually changed very little over the past several years. The number of pregnancies in this age group represented 22 percent of North Carolina's pregnancies in 1981, down slightly from 24 percent in 1978. While the changes for overall pregnancies among the state's population under 20 have been essentially unremarkable, there were substantial shifts in terms of pregnancy outcomes. An increasing proportion resulted in induced abortions while live births to teen and preteen mothers have declined.

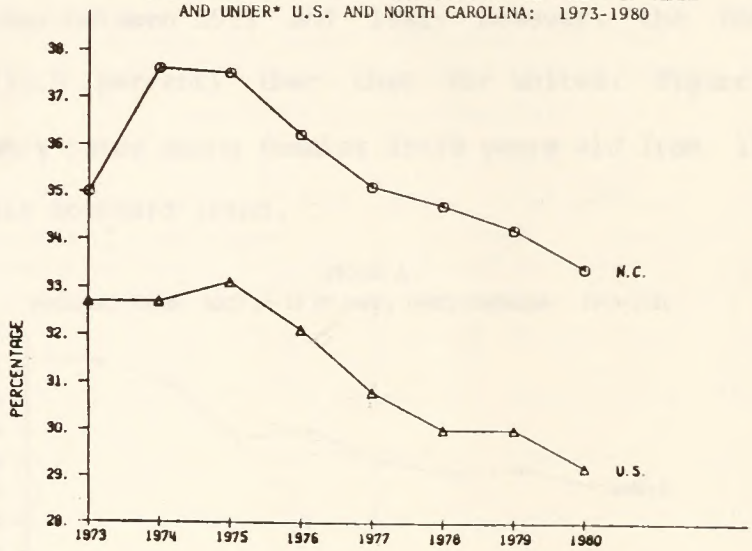
III. INDUCED ABORTIONS

In 1981, about 39 percent of pregnancies among North Carolina's 10-19 year olds were terminated by abortions. These 9,813 abortions represented almost one-third of all resident abortions reported in the state. Virtually 90 percent of these abortees were unmarried and about one-fourth had been pregnant before. Further, of the abortions which occurred to females under 20, 1,452 had had at least one previous abortion. (This is occurrence data rather than the residence data discussed throughout this report.)

While 1981 data for the United States are not yet available, in 1980 almost 30 percent of abortees in the nation were under 20 years old (The State's percentage was 33.4 for 1980). Figure B depicts the percentage of abortions obtained by those younger than 20 for North Carolina and the United States for 1973 through 1980. The state's percentage was higher throughout the period.

FIGURE B

PERCENTAGE OF REPORTED ABORTIONS FEMALES AGES 19 YEARS AND UNDER* U.S. AND NORTH CAROLINA: 1973-1980



*Data with age unknown are excluded.

Abortion Rates

North Carolina's younger women may have obtained a higher percentage of total abortions than did their U.S. counterparts, but the rate per 1,000 females was

lower for the state's 15-19 population than that reported for the nation. Table 2 shows these rates and their percent changes between 1974 and 1980. Although North Carolina's rate was consistently lower than the U.S. rate, there was a 70 percent increase in the state as compared to about 60 percent in the U.S.

Table 2

Abortion Rates* for Females 15-19 Years Old: Selected Years 1974 through 1980, North Carolina and the United States

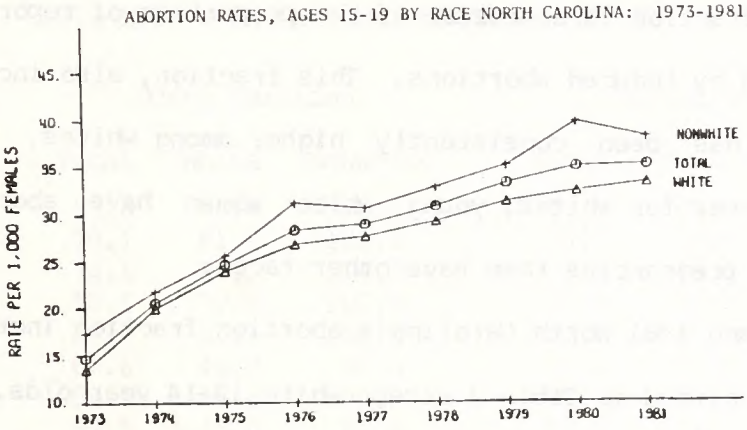
	1974	1977	1978	1979	1980	% Change Since 1974
North Carolina	20.6	28.9	30.8	33.2	35.0	+ 69.9%
United States	26.9	37.5	39.7	42.4	42.9	+ 59.5%

*Abortions per 1,000 female population ages 15-19.

Both the number and the rate of reported abortions increased dramatically in the years following the 1973 liberalization of abortion laws. Among North Carolinians 15-19 years old, the abortion rate increased 141 percent between 1973 and 1981. Figure C shows these rates by race and documents their upswing. While abortion rates were higher for nonwhites, this rate reached a peak at 39.7 in 1980 and declined to 38.1 the following year. The rate among whites climbed steadily throughout the period.

FIGURE C

ABORTION RATES, AGES 15-19 BY RACE NORTH CAROLINA: 1973-1981



Between 1978 and 1981, abortion rates for North Carolina's 10-19 year olds

increased 14 percent. Table 3 shows resident abortion data for 1978 and 1981 by age and race. The only decrease in abortion rates was among white 10-14 year olds, and both the number and rate of abortions increased for the older age groups.

TABLE 3

Nonwhite	2860	93.6	18.9	263.0	3238	93.5	21.6	311.0

* Rate per 1,000 female population, Race/Age-specific.
\+ Fraction per 1,000 pregnancies, Race/Age-specific.

Abortion Fraction

The abortion fraction is a measure of the proportion of reported pregnancies which are terminated by induced abortions. This fraction, also included in Table 3 (shown above), has been consistently higher among whites. Thus, while the abortion rate was lower for whites, young white women have aborted a greater proportion of their pregnancies than have other races.

Between 1978 and 1981 North Carolina's abortion fraction increased for every age/race category included in Table 3 except white 10-14 year olds. Also of note are the higher fractions in the younger age groups, indicating a greater propensity towards abortion among the very young.

IV. LIVE BIRTHS

The 15,164 live births among North Carolina's 10-19 year olds in 1981 marked a numerical decrease of 12.5 percent since 1978. These births represented approximately 18 percent of all births to residents of the state in 1981.

Birth Rates

The birth rate per 1,000 10-19 year old North Carolina females decreased from 34.0 in 1978 to 30.3 in 1981. Among 15-19 year olds, this rate decreased 34 percent between 1973 and 1981. U.S. birth rates for 1981 are not available, but Table 4 shows these rates for 15-19 year olds for N.C. and the U.S. from 1973 through 1980. As evidenced by these data, the state's birth rate remains higher than that for the nation. However, North Carolina's rate has declined steadily whereas the U.S. rate increased in 1979 and again in 1980. Thus, larger decreases in the state's birthrate have begun to close the gap between North Carolina and the nation.

TABLE 4

Birth Rates per 1,000 Females Ages 15-19 by Race,
North Carolina and the U.S.
1973-1980 with Percent Change Since 1973

	North Carolina			United States

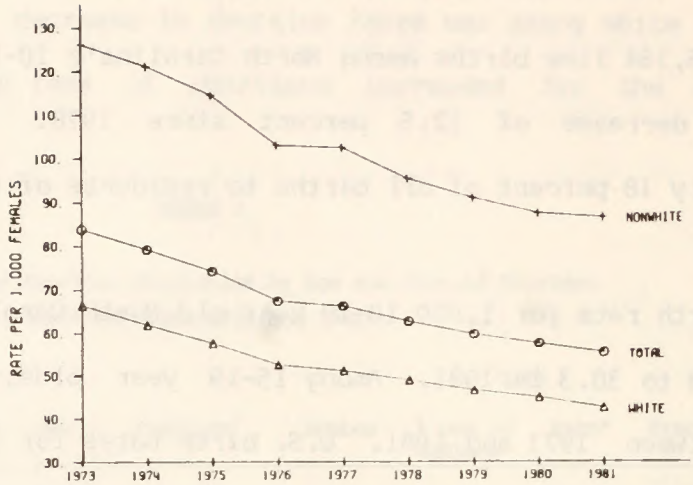
% Change Since 1973	-31.4	-32.2	-30.7	-10.6	-8.8	-19.5

Figure D shows the decreases in birth rates among North Carolina's 15 - 19 year olds for 1973 through 1981, and delineates the consistently higher rates for nonwhites.

FIGURE D

BIRTH RATES, AGES 15-19 BY RACE, NORTH CAROLINA: 1973-1981



Additional statistics on live births to North Carolina's young mothers are provided for 1978 and 1981 in Table 5. As indicated by these data, both the number and rate of births were highest for 18-19 year olds and lowest among those 10-14. Also noteworthy is the decrease in the percentage of total pregnancies which resulted in live births. This decrease corresponds to an increase in the abortion fraction, as discussed in a previous section of this report, and points to the change in pregnancy outcome being experienced by the state's teenagers.

TABLE 5

* Rate per 1,000 female population, Race/Age-specific.
\+ Percent of total pregnancies in each Race/Age group.

Out-Of-Wedlock Births

The data presented in Table 5 also document an increase in the percentage of out-of-wedlock births among 10-19 year olds between 1978 and 1981. Virtually 50

percent of these births occurred outside of marriage in 1981. As discussed in a previous section of this report, there was a similar increase in the total number of pregnancies which occurred out-of-wedlock. Since there was essentially no change in the percentage of out-of-wedlock abortions, it was the increased percentage of births to unwed mothers that affected the percentage of out-of-wedlock pregnancies.

Further examination of the data in Table 5 reveals that the percentage of out-of-wedlock births was highest among 10-14 year olds and lowest among 18-19 year olds. This percentage was also far higher among nonwhites although whites realized a greater increase between 1978 and 1981.

Birth Order

Despite decreases in birth rates among North Carolina's 10-19 year olds, several areas of concern arise when considering births to very young women. One such area relates to second-or higher-order births, which have increased percentagewise for this age group. Table 6 shows births by age and race with percentages according to birth order for 1978 and 1981. These data indicate that while the percentage of first births to mothers ages 20 and older increased between 1978 and 1981, an increased percentage of women under 20 were experiencing at least their second pregnancy. This was the case for all age/race categories with the exception of 10-14 year old whites, who had a reduced percentage of second or higher births in 1981.

TABLE 6

Live Births and Percentages by Birth Order by Age and Race of Mother:
North Carolina, 1978 and 1981

	1978				1981

Percent 2nd Born or Higher	5.9	19.5	41.9	77.5	7.0	19.8	42.1	76.3

* Cases in which birth order was not stated are not included in the totals.

Low Birthweight

Another area of concern when considering births to very young mothers is that they are more likely than others to deliver infants weighing 2500 grams or less (5 lbs. 8 oz.). These infants are considered premature and have higher rates of death or mental and physical abnormalities. Of the 6,589 low-weight babies born to North Carolina residents in 1981, 26 percent had mothers under the age of 20; recall that only 18 percent of total births were to mother under 20.

Table 7 shows the percentage of low-weight births by age and race of child for 1978 and 1981. At all ages, nonwhites had a higher percentage of low-weight births than did whites. Among white 10-14 year olds there was a decrease in this percentage while nonwhites in this age group had a slightly higher percentage of small babies in 1981 than in 1978. There was also an increase among 15-17 year olds of both races.

TABLE 7

Percentage of Low-weight* Births by Age and Race:
North Carolina, 1978 and 1981

	1978			1981		
Age	Total	White	Nonwhite	Total	White	Nonwhite
10-14	15.5	11.7	17.0	15.9	10.5	17.6

20 +	7.3	5.8	10.7	7.1	5.6	10.9

*2500 grams (5 pounds, 8 ounces) or less.

Prenatal Care

The absence of obstetrical care during the first three months of pregnancy has long been associated with subsequent health problems for both mother and child, and teenagers are much less likely to receive such care. In 1981, 44 percent of births to North Carolina's 10-19 year old residents followed

pregnancies in which no prenatal care was obtained during the first three months (if at all). In contrast, this was the case in about 19 percent of births to mothers 20 or older.

Table 8 shows the percentages of births to mothers who received no prenatal care in the first trimester, including those completely without care. Between 1978 and 1981 a decreasing percentage of births to mothers under 20 occurred without early care. The only exception was among 10-14 year old nonwhites. The data in Table 8 also show that the percentage of births following late or no prenatal care was highest for 10-14 year olds and decreased thereafter. This percentage was also consistently higher among nonwhites of all ages.

TABLE 8

Percent of Mothers Without Prenatal Care
In the First Trimester of Pregnancy by Age and Race:
North Carolina, 1978 and 1981

	1978			1981		
Age	Total	White	Nonwhite	Total	White	Nonwhite
10-14	63.8	60.8	64.8	66.5	52.3	71.0
15-17	53.0	45.8	60.0	49.9	43.4	55.9
18-19	40.8	34.1	50.4	39.5	33.1	48.4
20 +	20.2	12.2	34.8	18.7	13.4	31.5

V. FETAL DEATHS

Table 9 provides statistics on fetal deaths (stillbirths) for 1978 and 1981 by race for the age groups utilized throughout this report. Because of the very small numbers it is difficult to make any statement regarding fetal deaths for 10-14 year olds. However, for both racial groups, the fetal mortality rate for 15-17 year olds increased. The rate for white 18-19 year olds also increased while the corresponding nonwhite rate dropped about 23 percent between 1978 and 1981.

TABLE 9

Fetal Deaths and Rates* by Race and Age of Mother:
North Carolina, 1978 and 1981
With Percent Change in Rates Since 1978

	1978		1981		
Age 10-14	Number	Rate	Number	Rate	% Change
Total	14	36.1	12	32.3	-10.5
White	2	19.0	4	44.4	+133.7
Nonwhite	12	42.4	8	28.5	-32.8
Age 15-17					
Total	81	11.9	95	16.6	+39.5
White	31	9.4	38	14.0	+48.9
Nonwhite	50	14.4	57	19.0	+31.9
Age 18-19					
Total	135	13.0	115	12.4	-4.6
White	55	9.0	59	10.9	+21.1
Nonwhite	80	18.8	56	14.4	-23.4
Age 10-19					
Total	230	13.1	222	14.4	+9.9
White	88	9.2	101	12.3	+33.7
Nonwhite	142	17.7	121	16.9	-4.5

$$\text{*Fetal Mortality Rate} = \frac{\text{Fetal Deaths}}{\text{Fetal Deaths + Live Births}} \times 1000$$

It should be noted that fetal mortality rates are calculated using live births plus fetal deaths in the denominator. Since the number of fetal deaths for 10-19 year olds decreased from 1978 to 1981, the increase in the rate for these ages reflects a decrease in the number of live births.

VI. GEOGRAPHICAL DIFFERENCES

Regional Variations

Among the six Perinatal Care Regions (PCR's) designated in North Carolina, 1981 pregnancy rates for females under the age of 20 were highest in the Eastern (PCR VI) and Southeastern (PCR V) Regions. PCR VI had the highest pregnancy rate for 15-17 year olds and also the highest birth rate in this age group. While the fetal mortality rate for 15-17 year olds in PCR VI was higher than that for the state as a whole, the abortion rate was about average.

The Southeastern Region (PCR V) had the second-highest pregnancy and birth rates for 15-17 year olds. The fetal mortality rate for these ages was the highest in PCR V, but the region's abortion rate was slightly lower than the rate for North Carolina as a whole.

In terms of birth and pregnancy rates for 18-19 year olds, PCR V had the highest rates as well as the second-highest abortion rate. PCR VI followed with the second-highest birth and pregnancy rates, but had the lowest abortion rate among the regions and a relatively low fetal mortality rate as well.

The region with the lowest overall pregnancy rate among 15-17 year olds in 1981 was the Western PCR (I), which also had the lowest abortion rate and below-average birth and fetal mortality rates. The Northeastern PCR (IV) had the lowest pregnancy rate among 18-19 year olds and the lowest birth rates for both age groups. This region also reported the highest abortion rates for both age groups and the lowest fetal mortality rate for 18-19 year olds.

Of particular note among the regional differences is that the regions with the highest pregnancy rates for 15-17 year olds also had the highest birth rates coupled with average or lower abortion rates for those ages. In contrast, the region having the highest abortion rate for 18-19 year olds had the lowest overall pregnancy rate for those ages.

The four Department of Human Resources Regions exhibited essentially the same patterns as the PCR's. Table 10 provides regional pregnancy data by outcome for 1981.

TABLE 10

1981 Abortion, Birth, Fetal Mortality, and Pregnancy Rates by Age for Perinatal Care and Department of Human Resources Regions

	Abortion Rate		Birth Rate		Fetal Mortality Rate		Pregnancy Rate

North Carolina	25.3	48.9	36.4	81.6	16.6	12.4	62.3	131.6

North Carolina Counties

In terms of individual county statistics, Wilson County had the highest pregnancy rate among 15-17 year olds in 1981. That rate of 98.6 was 58 percent higher than the rate of 62.3 for North Carolina as a whole. Among 18-19 year olds the pregnancy rate was highest in Onslow County, where a rate of 215.4 was almost 64 percent higher than the state rate of 131.6. Table 11 shows the counties having the ten highest pregnancy rates for 15-17 and 18-19 year olds for 1981 as well as the number of events in these counties. Halifax, Edgecombe, and Onslow counties ranked among the ten highest for both age groups.

TABLE 11

Ten Highest Pregnancy Rates for Ages 15-17 and 18-19:
North Carolina Counties, 1981

Age 15-17				Age 18-19			
Rank	County	Number	Rate	Rank	County	Number	Rate
1	Wilson	175	98.6	1	Onslow	528	215.4
2	Warren	40	90.9	2	Swain	36	214.3
3	Halifax	144	90.0	3	Pamilco	37	211.4
4	Lee	87	87.3	4	Cumberland	944	192.9

6	Montgomery	46	85.3	6	Ashe	61	188.9
7	Durham	303	83.1	7	Hyde	19	188.1
8	Edgecombe	135	79.7	8	Halifax	178	184.3
9	Onslow	188	78.3	9	Anson	73	181.6
10	Granville	75	77.1	10	Edgecombe	178	178.0
10	Harnett	125	77.1				
	North Carolina	9629	62.3		North Carolina	14798	131.6

Wilson County also had the highest pregnancy rate for nonwhite 15-17 year olds at 135.6. This was about 45 percent higher than the state's rate of 93.6. Among 18-19 year olds, Swain county recorded the highest nonwhite pregnancy rate in 1981. At 345.5 this rate was more than twice the state rate. Counties not among those having the ten highest-ranking total pregnancy rates, but which had very high nonwhite rates, include Moore, with a rate of 136.9 for 15-17 year old nonwhites, and Henderson and Surry counties with rates of 333.3 and 311.5 respectively for nonwhites 18 and 19. The maps on pages 18 and 19 show 1981 pregnancy, birth, and abortion rates for 15-17 and 18-19 year olds by county.

VII. SUMMARY

The 25,199 pregnancies among North Carolina's 10-19 year olds in 1981 represented a rate of 50.3 pregnancies per 1,000 females. Of these, 9,813 resulted in induced abortions, 15,164 were live births, and 222 were fetal deaths.

Although both the number and rate of these pregnancies have decreased slightly over the past several years, the percentage of out-of-wedlock pregnancies for 10-19 year olds increased to 65 percent in 1981. There was also an increase in the percentage of second-or higher-order births.

North Carolina experienced a decrease in the number of births and fetal deaths among 10-19 year olds between 1978 and 1981, but at the same time the incidence of abortions rose. While the abortion rate was higher for nonwhites (as were birth and fetal mortality rates), the abortion fraction was higher among whites and increased for both racial groups between 1978 and 1981.

While all pregnancies among North Carolina's population under 20 are of concern, those occurring to young women under the age of 18 warrant special consideration. The 10,410 pregnancies for 10-17 year olds in 1981 represented a 7.5 percent decrease from the more than 11,000 recorded for 1978. Among these ages, fetal mortality and the incidence of induced abortions both increased between 1978 and 1981.

The Surgeon General's office has established a number of goals for improvement of the nation's health by 1990. (15) While no specific goals were suggested for reducing the incidence of abortions, certainly efforts to do so are consistent with the elimination of unwanted pregnancies if such reductions can be had without corresponding increases in live births. This is especially true of repeat abortions occurring among the very young. Beyond this, the Surgeon General's report targeted live births to teenage mothers for the following annual rate reductions by 1990: 10 percent for those below age 15, 2.5 percent at age

15, 1.8 percent at age 16, and 1.1 percent at age 17. For North Carolina to realize comparable improvements, the state's 1990 birth rate should be virtually zero for adolescents under 15. Among 15 year olds this rate should be 13.2, while 16 year olds should have a birth rate no higher than 31.2 and 17 year olds a rate no higher than 53.0. With these goals in mind the state must do better than the rest of the nation in order to bring its rates down to average. As such, North Carolina must bolster its efforts toward reducing pregnancies among teens and preteens.

APPENDIX A

Definitions and Formulas

1. Induced Abortion - The purposeful interruption of pregnancy with the intention other than to produce a live born infant or to remove a dead fetus and which does not result in a live birth.

2. Live Birth - The complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or any definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is atttached. (Definition adopted by World Health Organization in 1950.)

3. Fetal Death - Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, as indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. (Definition adopted by World Health Organization in 1950.) Consistent with North Carolina law, this report includes only fetal deaths which do not qualify as induced abortions and which result from pregnancies of 20 or more weeks gestation.

4. Total Pregnancies - The sum of all reported conceptions regardless of their outcome.

5. Out of Wedlock - Includes females who were divorced, widowed, or never married at the time the pregnancy outcome was reported. For births and fetals, mother has to have been divorced or widowed in excess of 280 days.

6. Low Birthweight - Infants weighing 2500 grams (5 pounds, 8 ounces) or less at birth.

All rates are calculated using age/race specific numerators and denominators. For example, if the rate is for a particular age group and/or race category then the events (numerator) are those occurring in this age/race group as is population (denominator).

$$\text{Abortion Rate} = \frac{\text{number of induced abortions}}{\text{number of females}} \times 1000$$

$$\text{Abortion Fraction} = \frac{\text{number of induced abortions}}{\text{number of reported pregnancies}} \times 1000$$

$$\text{Birth Rate} = \frac{\text{number of live births}}{\text{number of females}} \times 1000$$

$$\text{Fetal Mortality Rate} = \frac{\text{number of fetal deaths}}{\text{number of live births + fetal deaths}} \times 1000$$

$$\text{Pregnancy Rate} = \frac{\text{induced abortions + live births + fetal deaths}}{\text{number of females}} \times 1000$$

Explanation of Reference Tables

The tables in Appendix B provide the number of reported induced abortions, live births, fetal deaths, and total pregnancies in 1981 by race for the following age groups: 10-14, 15-17, 18-19, and 20 and older.

The next set of numbers represents those outcomes for unmarried females in the same age groups in 1981.

The lower portion of each table lists rates per 1000 population for the above-mentioned age groups for 1981. For those older than 14, the tables also list the percent change in rates since 1978, all according to the particular pregnancy outcomes listed across the top of the table. These percentages indicate whether a particular rate has increased or decreased since 1978 for specific age/race groups. The percentage change was not calculated for 10-14 year olds due to the very small numbers involved on the county level. Fetal mortality rates were not calculated for that same reason.

The advantage of looking at rates in addition to numbers is that the rate puts the number of events into perspective relative to the specific population of interest. However, when small numbers comprise the bases for rate computations, caution must be taken in any analysis of the resulting rates. A difference in rates may be attributed either to fluctuations in the number of events or in the population or both.

Small numbers complicate the issue by sometimes producing large rate fluctuations based only on very small actual changes. For this reason, the rates in some counties appear to have changed a great deal between 1978 and 1981, when in fact the change in numbers was slight. As an example, Greene County white 15-17 year olds experienced a birth rate increase of almost 250 percent from 1978 to 1981. In looking at the numbers involved, however, there was one birth in 1978 and three in 1981 while the number of 15-17 year olds decreased by thirty. Thus,

a combination of these factors produced the high percentage change in rates.

Because so many counties exhibited apparently large changes from 1978 to 1981, additional information is necessary to accurately assess such changes. The supplement to Appendix B provides additional data for all counties which showed a rate increase of 100 percent or more or a decrease of 50 percent or more in any age/race/outcome group. For these counties, the supplemental data include the county name, age group, race, and pregnancy outcome category for which large percentage changes occurred, and the number of events and population in that category for 1978 and 1981. Sixty-one of the 100 North Carolina counties experienced a large percentage change in rates in at least one age/race/outcome category.
